

Experiment 1**Date: 21.09.2023****Advanced Use of GCC****Aim:**

1. Advanced use of gcc : Important Options -o, -c, -D, -l, -I, -g, -O, -save-temps, -pg

Write a C program 'sum.c' to add two numbers. Read the input from Standard Input and write output to Standard output. Compile and generate output using gcc command and its important options.

Program

```
#include<stdio.h>
void main(){
    int a,b;
    printf("Enter 2 numbers : ");
    scanf("%d %d",&a,&b);
    printf("Sum : %d",a+b);
}
```

GCC

GCC is a Linux-based c compiler released by the free software foundation which is usually operated via the command line. It often comes distributed freely with a Linux installation, so if you are running Unix or a Linux variant you will probably have it on your system. You can invoke gcc on a source code file simply by typing:-

gcc filename

The default executable output of gcc is "a.out", which can be run by typing "./a.out". It is also possible to specify a name for the executable file at the command line by using the syntax " -o outputfile", as shown in the following example: -

gcc filename -o outputfile

Again, you can run your program with "./outputfile". (the ./ is there to ensure to run the program for the current working directory.)

Note: if you need to use functions from the math library (generally functions from math.h" such as sin or sqrt), then you need to explicitly ask it to link with that library with the "-l" flag and the library "m":

gcc filename -o outputfile -lm**Output**

```
mits@mits-Lenovo-S510:~/Desktop/s1mca$ gcc sum.c
mits@mits-Lenovo-S510:~/Desktop/s1mca$ ./a.out sum.c
Enter 2 numbers : 6 4
Sum : 10
```

Important Options in GCC**Option: -o**

To write and build output to output file.

Output

```
mits@mits-Lenovo-S510:~/Desktop/s1mca$ gcc sum.c -o sum_out
```

Here, GCC compiles the sum.c file and generates an executable named sum_out.

Option: -c

To compile source files to object files without linking.

Output

```
mits@mits-Lenovo-S510:~/Desktop/s1mca$ gcc -c sum.c
```

This will generate an object file sum.o that can be linked separately.

Option: -D

To define a preprocessor macro.

Output

```
mits@mits-Lenovo-S510:~/Desktop/s1mca$ gcc -D debug=1 sum.c
```

This defines the macro 'DEBUG' with the value 1, which can be used in the source code.

Option: -I

To include a directory of header files.

Output

```
mits@mits-Lenovo-S510:~/Desktop/s1mca$ gcc -o sum.c sum_out.c -lm
```

Here, the -lm option links the math library (libm) with the sum.c.

Option: -I

To look in a directory for library files.

Output

```
mits@mits-Lenovo-S510:~/Desktop/s1mca$ gcc -o sum.c sum_out.c -I./ads_lab
```

This tells GCC to look for header files in the ads_lab directory.

Option: -g

To debug the program using GDB.

Output

```
mits@mits-Lenovo-S510:~/Desktop/s1mca$ gcc -g sum.c -o sum_out
```

This compiles sum.c with debug information, enabling you to debug the resulting executable.

Option: -O

To optimize for code size and execution time.

Output

```
mits@mits-Lenovo-S510:~/Desktop/s1mca$ gcc -O3 -o my_pgm sum.c
```

This compiles sum.c with a high level of optimization.

Option: -pg

To enable code profiling.

Output

```
mits@mits-Lenovo-S510:~/Desktop/s1mca$ gcc -pg -o my_pgm sum.c
```

This compiles source.c with profiling support, allowing you to use profilers like gprof.

Option: -save-temps

To save temporary files generated during program execution.

Output

```
mits@mits-Lenovo-S510:~/Desktop/s1mca$ gcc -save-temps -o my_pgm sum.c
```

This will generate intermediate files, like sum.i (pre-processed source) and sum.s (assembly code), in addition to the final executable.

Experiment 2**Date: 21.09.2023****Familiarisation with GDB****Aim:**

2. Familiarisation with gdb: Important Commands - break, run, next, print, display, help. Write a C program 'mul.c' to multiply two numbers. Read the input from Standard Input and write output to Standard output. Compile and generate sum.out which is then debug with gdb and commands.

Program

```
#include<stdio.h>
void main(){
    int a,b;
    printf("Enter 2 numbers : ");
    scanf("%d %d",&a,&b);
    printf("Product : %d",a*b);
}
```

Output

```
mits@mits-Lenovo-S510:~/Desktop/s1mca$ gcc -g mul.c -o mul_out
mits@mits-Lenovo-S510:~/Desktop/s1mca$ gdb mul_out
```

```

```

```
For help, type "help".
Type "apropos word" to search for commands related to "word"...
Reading symbols from sum1...
(gdb) run
```

```
Starting program: /home/mits/Desktop/Poojas1MCA/sum1
```

[Thread debugging using libthread_db enabled]

Using host libthread_db library "/lib/x86_64-linux-gnu/libthread_db.so.1".

Enter 2 numbers : 10 20

Product : 200 [Inferior 1 (process 23588) exited normally]

(gdb) **quit**

Important Commands in GDB

Command: break

Sets a breakpoint on a particular line.

Output

(gdb) break mul.c:5

Command: run

Executes the program from start to end.

Output

(gdb) run

Command: next

Executes the next line of code without diving into functions.

Output

(gdb) next

Command: print

Displays the value of a variable.

Output

(gdb) print a

(gdb) a 10

Command: display

Displays the current values of the specified variable after every step.

Output

```
(gdb) display a
```

```
1: a=10
```

Experiment 3**Date: 29.09.2023****Familiarisation with gprof****Aim:**

3. Write a program for finding the sum of two numbers using a function. Then profile the executable with gprof.

Program

```
#include<stdio.h>
int sum(int x, int y){
    return x+y;
}
void main(){
    int a,b;
    printf("Enter 2 numbers : ");
    scanf("%d %d",&a,&b);
    printf("Sum : %d",sum(a,b));
}
```

Output

```
mits@mits-Lenovo-S510:~/Desktop/s1mca$ gcc sum.c
mits@mits-Lenovo-S510:~/Desktop/s1mca$ gcc ./a.out sum.c
Enter 2 numbers : 10 20
Sum : 30
```

```
mits@mits-Lenovo-S510:~/Desktop/s1mca$ gcc -o sum.out -pg sum.c
mits@mits-Lenovo-S510:~/Desktop/s1mca$ ./sum.out
Enter 2 numbers : 10 20
Sum : 30
```

```
mits@mits-Lenovo-S510:~/Desktop/s1mca$ gprof ./sum.out gmon.out > pgm3.txt
```

pgm3.txt

Flat profile:

Each sample counts as 0.01 seconds.

no time accumulated

| % | cumulative | self | | self | total | |
|------|------------|---------|-------|---------|---------|------|
| time | seconds | seconds | calls | Ts/call | Ts/call | name |
| 0.00 | 0.00 | 0.00 | 1 | 0.00 | 0.00 | sum |

Experiment 4**Date: 29.09.2023****Different types of functions****Aim:**

4. Write a program for finding the sum of two numbers using different types of functions.

Algorithm:**main()**

1. Start
2. Declare ch,a,b.
3. Display choices.
4. Read option ch.
 - a. if ch==1 call sum1().
 - b. if ch==2 input a and b and call sum2().
 - c. if ch==3 print sum3().
 - d. if ch==3 input a and b and print sum4().
5. Repeat steps 3 while ch>0&&ch<4.
6. Stop.

void sum1()

1. Start
2. Declare a and b.
3. Read a and b.
4. Print a+b.
5. Exit.

void sum2(int a, int b)

1. Start
2. Print a+b.
3. Exit.

int sum3()

1. Start
2. Declare a and b.
3. Read a and b.
4. Return a+b.
5. Exit.

int sum4(int a, int b)

1. Start
2. Return a+b
3. Exit.

Program

```
#include<stdio.h>
void sum1(){
    int a,b;
    printf("Enter 2 numbers : ");
    scanf("%d %d",&a,&b);
    printf("Sum : %d",a+b);
}
void sum2(int a, int b){
    printf("Sum : %d",a+b);
}
int sum3(){
    int a,b;
    printf("Enter 2 numbers : ");
    scanf("%d %d",&a,&b);
    return a+b;
}
int sum4(int a, int b){
    return a+b;
}
void main(){
    int ch,a,b;
    do{
        printf("1. Function without return type and arguments\n2. Function without return
type and with arguments\n3. Function with return type and without arguments\n4.
Function with return type and arguments\n5. Exit\nEnter your choice(1-4): ");
        scanf("%d", &ch);
        switch(ch){
            case 1: sum1();
                break;
            case 2: printf("Enter 2 numbers : ");
                scanf("%d %d",&a,&b);
                sum2(a,b);
                break;
            case 3: printf("Sum : %d",sum3());
                break;
            case 4: printf("Enter 2 numbers : ");
                scanf("%d %d",&a,&b);
                printf("Sum : %d",sum4(a,b));
```

```
        break;
    }
    }while(ch>0&&ch<4);
}
```

Output

```
mits@mits-Lenovo-S510:~/Desktop/s1mca$ gcc PGM1.c
mits@mits-Lenovo-S510:~/Desktop/s1mca$ ./a.out PGM1.c
```

```

Sum : 500
```

1. Function without return type and arguments
2. Function without return type and with arguments
3. Function with return type and without arguments
4. Function with return type and arguments
5. Exit

Enter your choice: 5

mits@mits-Lenovo-S510:~/Desktop/s1mca\$

Experiment 5**Date: 06.10.2023****Array Operations****Aim:**

5. To implement a menu driven program to perform following array operations
 - a. Insert an element to a particular location.
 - b. Delete an element from a particular location.
 - c. Traverse

Algorithm:**main()**

1. Start
2. Declare ch,a[50],p,x and n.
3. Display choices.
4. Read option ch.
 - a. if ch==1 call insert().
 - b. if ch==2 call del().
 - c. if ch==3 call display()
5. Repeat steps 3 while ch>0&&ch<4.
6. Stop.

void insert()

1. Start
2. Read the element and it's position.
3. Check if p>n if true print Invalid Position.
4. else n++

```
for(int i=n-1;i>=p;i--){
    a[i]=a[i-1];
}
```

```
a[p-1]=x;
```
5. Exit

void del()

1. Start
2. Read the position of the element to be deleted.
3. Check if p>n if true print Invalid Position.
4. else n--

```
print a[p-1] is deleted
```

```
        for(int i=p-1;i<=n-1;i++){
            a[i]=a[i+1];
5. Exit
```

void display()

```
6. Start
7. for(int i=0;i<n;i++){
        print a[i]
    }
8. Exit
```

Program

```
#include<stdio.h>
int a[50],p,x,n;
```

```
void insert(){
    printf("Enter the element and it's position : ");
    scanf("%d %d",&x,&p);
    if(p>n){
        printf("Invalid Position");
    }
    else{
        n++;
        for(int i=n-1;i>=p;i--){
            a[i]=a[i-1];
        }
        a[p-1]=x;
    }
}

void del(){
    printf("Enter position of the element to be deleted : ");
    scanf("%d",&p);
    if(p>n){
        printf("Invalid Position");
    }
    else{
        n--;
        printf("%d is deleted",a[p-1]);
        for(int i=p-1;i<=n-1;i++){
            a[i]=a[i+1];
        }
    }
}
```

```
}  
void display(){  
    printf("Array : ");  
    for(int i=0;i<n;i++){  
        printf("%d \t",a[i]);  
    }  
}  
void main(){  
    printf("Enter the size of the array : ");  
    scanf("%d",&n);  
    printf("Enter array : ");  
    for(int i=0;i<n;i++){  
        scanf("%d",&a[i]);  
    }  
    int ch;  
    do{  
        printf("1. Insert\n2. Delete\n3. Display\n4. Exit\nEnter your choice(1-4) : ");  
        scanf("%d",&ch);  
        switch(ch){  
            case 1 : insert();  
                    break;  
            case 2 : del();  
                    break;  
            case 3 : display();  
                    break;  
        }  
    }while(ch>0&&ch<4);  
}
```

Output

```
mits@mits-Lenovo-S510:~/Desktop/s1mca$ gcc array.c  
mits@mits-Lenovo-S510:~/Desktop/s1mca$ ./a.out array.c
```

```
Enter the size of the array : 5  
Enter array : 2 4 5 6 8
```

```
1. Insert  
2. Delete  
3. Display  
4. Exit
```

```
Enter your choice(1-4) : 1
```

```
Enter the element and it's position : 3 2
```

1. Insert
2. Delete
3. Display
4. Exit

Enter your choice(1-4) : 3

Array : 2 3 4 5 6 8

1. Insert
2. Delete
3. Display
4. Exit

Enter your choice(1-4) : 2

Enter position of the element to be deleted : 2

3 is deleted

1. Insert
2. Delete
3. Display
4. Exit

Enter your choice(1-4) : 3

Array : 2 4 5 6 8

1. Insert
2. Delete
3. Display
4. Exit

Enter your choice(1-4) : 4

mits@mits-Lenovo-S510:~/Desktop/s1mca\$

Experiment 6**Date: 06.10.2023****Array Sorting****Aim:**

6. Program to sort an integer array

Algorithm:**main()**

1. Start
2. Declare a[50], and n.
3. Read n and input n elements to a.
4. Print a before sorting by calling display().
5. Call sort().
6. Print a after sorting by calling display().
7. Stop.

void sort()

1. Start
2.

```
for(int i=0;i<n-1;i++){
    for(int j=0;j<n-i-1;j++){
        if(a[j]>a[j+1]){
            int t=a[j];
            a[j]=a[j+1];
            a[j+1]=t;
        }
    }
}
```
3. Exit

void display()

1. Start
2.

```
for(int i=0;i<n;i++){
    print a[i]
}
```
3. Exit

Program

```
#include<stdio.h>
int a[50],n;

void sort(){
for(int i=0;i<n-1;i++){
    for(int j=0;j<n-i-1;j++){
        if(a[j]>a[j+1]){
            int t=a[j];
            a[j]=a[j+1];
            a[j+1]=t;
        }
    }
}

void display(){
    printf("Array : ");
    for(int i=0;i<n;i++){
        printf("%d \t",a[i]);
    }
}
